A. Six differential-enrichment methods integrated by correlation-corrected Fisher combination

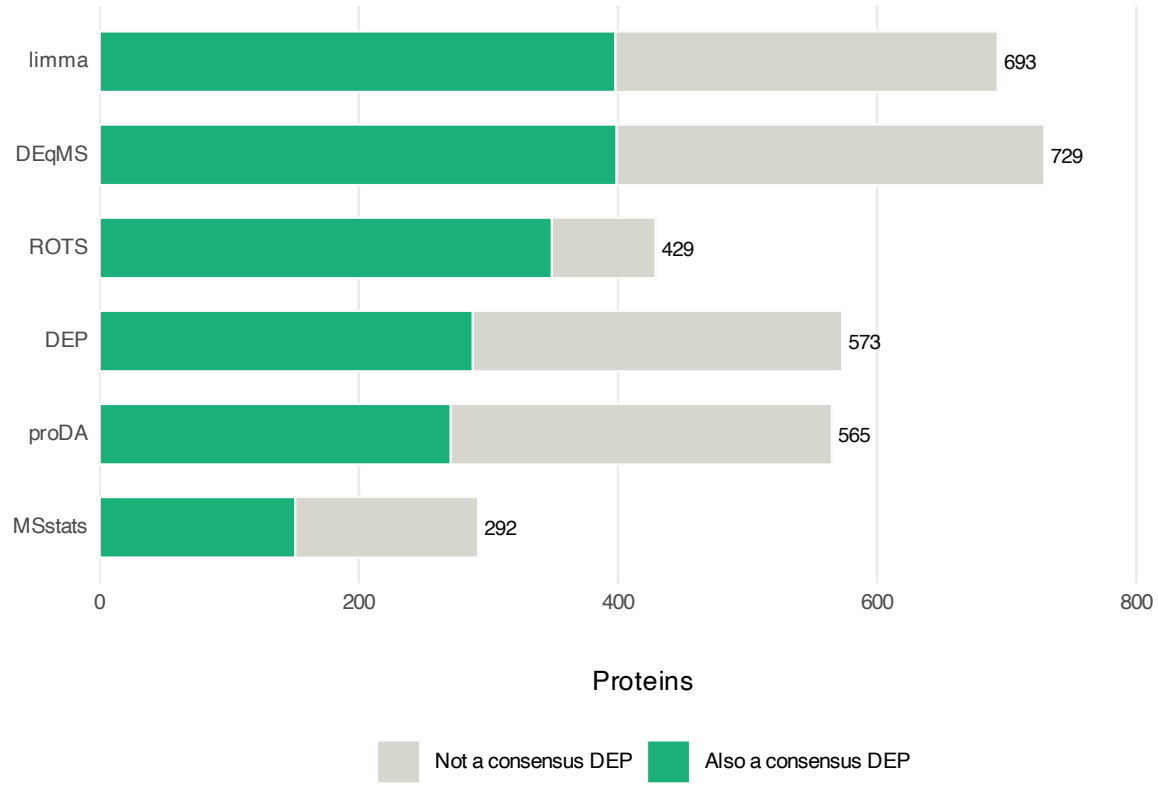

B. Combined methods are correlated

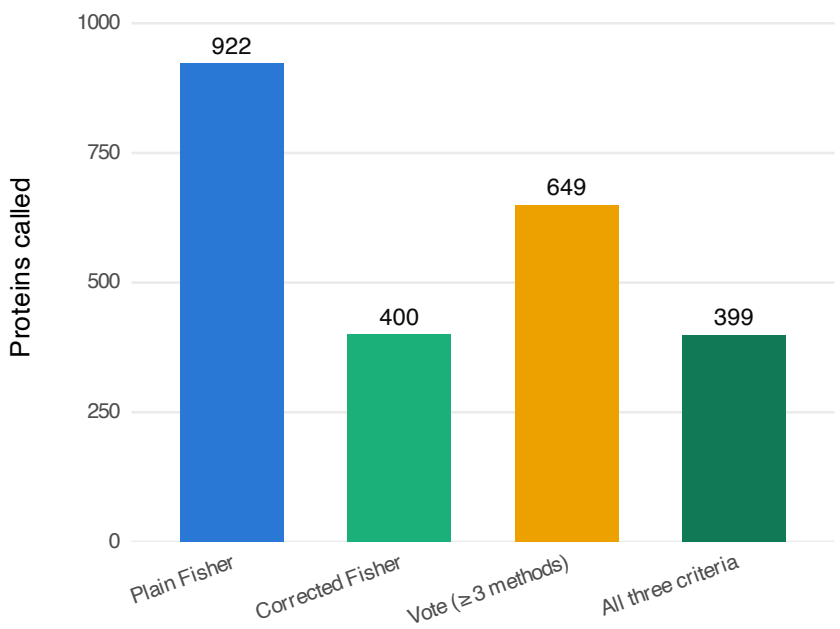

C. Each method alone vs the consensus

Proteins significant per method ($p \le 0.05$, $|log2FC| > 0.25$); consensus n = 399

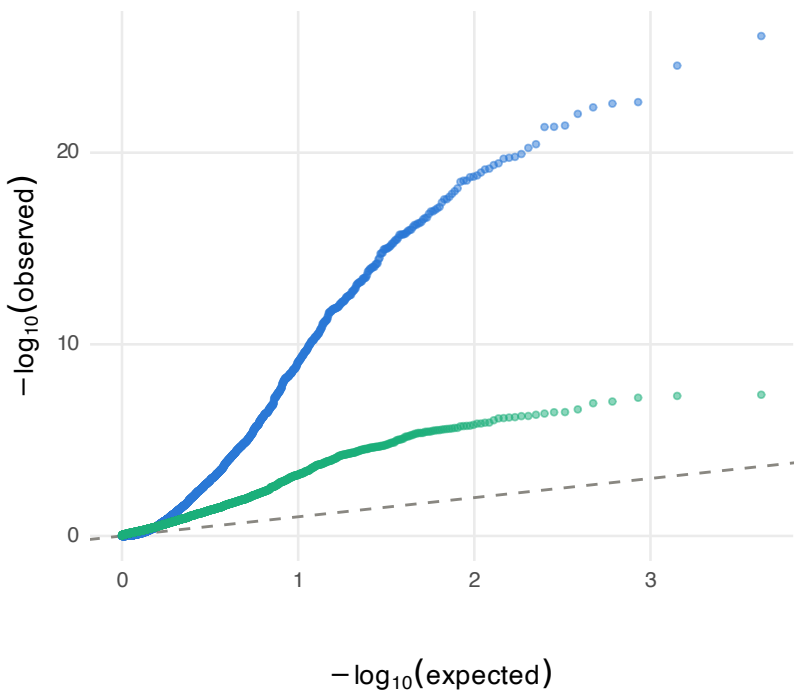

D. Plain Fisher over-calls

adj. $p \le 0.05$ and $|max\ log2FC| > 0.25$

E. Correction removes p-value inflation

F. Detection by corrected Fisher

Aqua: 399 consensus DEPs (all three criteria)
